SUMMARY

Full-stack AI automation engineer who scopes messy business workflows, builds LLM-powered prototypes, and turns working patterns into reusable agent runtimes. Built WebGPT, an open-source browser/spreadsheet agent system; deployed WebGPT-powered workflows for a real estate operations team; and prototyped DesignGPT, an embeddable enterprise AI-agent framework for Lutron web applications.

SKILLS

Languages	TypeScript, JavaScript, Python, Java, C#, C, C++, SQL, Bash, HTML, CSS
AI / Agents	OpenAI APIs, planner/executor loops, browser agents, tool/action contracts, structured extraction, human-in-the-loop review, workflow replay
Frontend / Runtime	React, Chrome MV3 Extensions, Vite, content scripts, service workers, Chrome Identity, OAuth, runtime surfaces
Backend / APIs	Node.js, Express, OpenAPI, REST APIs, Microsoft Graph, Google Sheets API, run/session orchestration, artifact services
Cloud / DevOps	Azure, AWS Lambda, S3, CI/CD, Railway, Kubernetes
Workflow Automation	customer discovery, rapid prototyping, operations workflows, document automation, generative media workflows, reusable playbooks

PROJECTS

WebGPT — Open-Source AI Workflow Agent Platform

TypeScript, React, Chrome MV3, Node.js, Express, OpenAI APIs, OpenAPI, Google Sheets API, Microsoft Graph

- Published WebGPT as a Chrome extension for beta users with a deployed hosted planner backend, enabling natural-language workflows across browser, spreadsheet, and document-heavy operations.
- Built an open-source agent platform that turns natural-language goals into browser actions, spreadsheet API operations, and replayable workflows across **browser_dom**, **browser_cdp**, **google_sheets**, and **microsoft_excel** surfaces.
- Designed WebGPT as reusable infrastructure for customer-specific workflows: site/content adapters for messy web apps, runtime surfaces for API-backed tools, and bring-your-own planner backends through an OpenAPI-style contract.
- Built the Chrome frontend runtime with sidepanel UX, structured multi-frame state extraction, action execution, navigation recovery, human hints, success confirmation, saved artifacts, template queues, and workflow replay.
- Added five loaded site/content adapters for Canvas quiz workflows, Yelp, NCM movie calendars, DocuSign, and Dotloop, turning brittle web pages into planner-readable workflow surfaces.
- Built the hosted default planner backend used by the frontend, including Express APIs for command runs, command-result loops, run snapshots, lifecycle controls, human feedback, artifacts, and template queues.
- Implemented backend orchestration for browser actions, replay batches, Google Sheets commands, Microsoft Excel commands, navigation waits, human assistance, and done states.
- Added replay preflight, successful-run artifacts, execution traces, input binding, template goal substitution, surface-aware planning, post-step processing, state deltas, action-effect summaries, and backend test coverage.

Student Landing — Real Estate Operations Automation

WebGPT, Dotloop, Atlas Philly, Philadelphia government websites, workflow automation

- Partnered with Student Landing, a Philadelphia student-services real estate firm, to automate document and property-verification workflows used by its operations team.
- Mapped operator workflows for preparing and sending agreements in Dotloop, then deployed WebGPT-powered routines that convert repeatable document steps into guided browser-agent workflows.

- Built property-verification workflows that collect and cross-check lead information from Atlas Philly and Philadelphia government websites, reducing repeated manual lookup work during real-estate operations.
- Used the deployment to harden WebGPT's Dotloop adapter, source-value extraction, document-field mapping, workflow replay, and human-review patterns for real operator use.

CropGPT — Intent-to-Edit Media Automation Engine

Python, FFmpeg, JSON Schema, CLI tooling, media QA

- Built CropGPT, a creative workflow system that translates intent into reusable edit actions such as cropping, stacking, captioning, CTA placement, audio normalization, export, and QA.
- Used CropGPT to produce WebGPT YouTube Shorts demo videos from product recordings, creating vertical demos with branded captions, transcripts, contact sheets, metadata, and review notes.
- Extended CropGPT into generative interior-design workflows with an interior-design collaborator, translating rough room plans and style intent into furnished-room image-generation specs for review and iteration.
- Implemented a recipe-driven media pipeline with validation, deterministic FFmpeg rendering, loudness checks, and review reports so new video formats can define their own editing actions instead of relying on one-off scripts.

EXPERIENCE

Lutron — Project Application Software Engineer

Jan 2022 – Present

- Built a prototype embeddable AI-agent framework for Lutron web applications, repurposing WebGPT's engine pattern so host applications could expose domain skills while the agent handled chat, planning, and execution mechanics.
- Automated and optimized mission-critical Azure deployment workflows, using CI/CD and DevOps processes to move code and content from development to production.
- Resolved 100+ production bugs and multiple P1/P2 outages by prioritizing customer-impacting failures, debugging root causes, and coordinating fixes across production systems.
- Built React and serverless features for home-automation workflows, including AWS Lambda/S3-backed web functionality for creating complex scenes.
- Created a React microfrontend embedded in a WPF application, consuming Logik.io headless APIs to support configurable product selection in a design-to-order workflow.
- Delivered MuleSoft middleware integrating a WPF application with Salesforce CPQ and Logik.io, then built a Maven-based CI/CD pipeline for Anypoint deployment.
- Served as epic owner for exporting line items to Salesforce, translating ambiguous business needs into development stories, unblocking engineers, and coordinating cross-team delivery.

Earlier Software Engineering Roles

2018 – 2021

Infinite Solutions · Euronet · Jet Airways

- Built Java Spring / Angular healthcare web systems, REST and WebSocket APIs, banking microservices, Kubernetes-deployed services, Python prediction workflows, and Android integrations before joining Lutron full-time.

EDUCATION

Harrisburg University of Science and Technology

M.S., Computer Information Sciences — Software Engineering / Software Testing concentration

GPA: 3.30 / 4.00 · 30 graduate credits completed

Virginia Tech, College of Engineering

B.S., Computer Science

GPA: 3.01 / 4.00 · Dean's List: Spring 2020 – Spring 2021

Additional Quantitative Coursework

Baruch Pre-MFE Advanced Calculus and Probability (Certificate of Distinction); University of Chicago Linear Algebra and Python. Projects: mean-reverting portfolio optimization, SOFR futures modeling, trading bots, and options-data analysis.
